Focus: Analyze and recommend options for adapting to impacts on climate change on Alaska’s natural biotic ecosystems and resources, and uses of those resources.

Status: Working on development of Catalog of options that represents the expertise and recommendations of the full TWG.

Next steps: Catalog and selection criteria are key objectives of TWG teleconference in late September and October 27 meeting in Anchorage.
Examples of Policy Areas

- Agriculture
- Forestry & wildfire
- Invasive species
- Habitat & dependent species
- Water conservation
- Sea- and river-ice forecasting
- Fish and wildlife management
- Commercial fisheries
- Tourism
- Public education
Policy: Invest in production of food and expansion of markets for products grown in Alaska under conditions of longer warmer seasons.

Examples of potential actions:
- Start-up funding for communities that become warm enough to establish successful gardens.
- Ensure long-term availability of agricultural land near communities (e.g. through land trusts).
- Pursue USDA classification of Alaskan produce as food (not horticulture), to be eligible for subsidies.
- **Policy:** Fund information outreach to potential tourists about longer summers and milder winter recreational opportunities.

- **Policy:** Provide funding to communities to assess consequences of altered tourism patterns and provide incentives for necessary changes in services.
Policy: Establish a task force of agency, NGO and community representatives to identify habitats and species at risk to climate warming and to develop strategies for protection of these habitats and/or migration of these species.

Examples of potential actions:
- Request that US Fish and Wildlife Service develop a plan to conserve species and habitats at risk of climate change.
- Fund management experiments in habitats more likely to become more common with climate warming (e.g., to enhance habitats’ suitability for species conservation.)
