T-1. Transit, Ridesharing, and Commuter Choice Programs

Policy Description

The state would provide the leadership and resources necessary to help expand Alaska’s public transit and ridesharing system. To alter Alaskan driving habits to reduce GHG emissions, issues of convenience, choice, and finance must be major elements in expanded transit and ridesharing operation. Public education will be paramount to success.

In order to reduce GHG emissions though expanding transit opportunities, commuters need to be provided with progressive incentives to change behavior. Intense, long term education must be undertaken to demonstrate the financial savings for transit users. Current successful van routes from Wasilla into Anchorage appear to offer cost savings to the users. The overall system connections, from parking lot to rail to bus routes, must meet citizen demands to get from home to workplace and lead to a public awareness of system functionality. Piecemeal programs will fade away with the lack of public buy in.

The majority of GHG reduction with increased transit and ridesharing service is expected to be achieved in the state’s larger population areas.

If funding is not allocated to initiate the larger programs, then beginning with individual large employers incorporating financial incentives may be the best method to show success.

Policy Design

This option would:

• Develop park-and-ride systems that are coupled to increased urban transit schedules. Estimates of new infrastructure will be needed in cold areas to keep car engines heated.

• Develop outlying collector routes with buses or vans to high employment destinations, i.e., university campuses, oil industry offices, and state offices. A daytime shuttle or van offer to provide for personal lunch time trips has been demonstrated in the private workplace.

• Provide funding support to expand the current transit systems operations to increase the frequency of in-town schedules.

• Develop rail tie-in along existing track. DMU cars from Wasilla to Anchorage and North Pole - UAF Campus through Fairbanks would be leased on an initial winter basis. Funding would be provided to invest in these cars and a program operator, a possible statewide or regional transit authority.

• ADOT&PF will help achieve an expansion of transit services in Alaska communities including coordinated transit solutions, and seek additional funds to support this expansion.
Goals:

- Double transit ridership in Alaska by 2025, compared to 2007 levels.
- Double ridesharing in Alaska by 2025, compared to 2007 levels.
- Support the development of a Regional Transportation Authority in Anchorage and Fairbanks to integrate all alternatives into one coordinated regional system. This system would eventually include rail, bus transit, paratransit, and ferries where appropriate.

Timing: See above.

Parties Involved: Local transit authorities, Alaska Railroad, local and state government, Alaska DOT

Implementation Mechanisms

The State of Alaska should develop legislation that provides transit funding that augments current FTA grants and/or pass through funds in combination with local government operational funding. A state funding source could be an incentive for small local governments to consider implementing limited transit operations in central core areas.

To the extent that commuter van ride sharing is operated primarily by rider subscription, this approach may offer a fractional reduction in GHG emissions in less densely populated locales associated with urban work environments.

Related Policies/Programs in Place

Transit in Anchorage

Since 2002, People Mover ridership in Anchorage has exceeded estimations. Service enhancements through route restructuring and increases in operations, combined with high fuel prices, have attracted more commuters resulting in 2008 ridership being the highest in People Mover’s history. Future plans to improve service frequency to a bus every ½ hour from 6 a.m. to 6 p.m., as well as increased peak hour frequency on seven routes in corridors that have the highest ridership.

While the trend in Anchorage is matching the success of transit systems in the lower 48, Anchorage riders are more responsive to service increases. The industry standard for new service is that a 10% increase in service will result in a 7% increase in riders. Changes made since 2002 have increased service 18% with a corresponding 28% increase in riders indicating a strong latent demand for public transportation.

Anchorage’s Long Range Transportation Plan addresses high frequency, high performance express bus service on the Glenn Highway corridor to pick-up 5-7 percent of the peak-period commuters.

Currently the transit fixed route fleet has 55 buses. People Mover’s long range goals double the size of the fleet. In the short term, approximately $7 million is needed to replace the aging fleet, and another 20-25 buses are needed to meet the goals of the increased frequency on key corridors. The increased transit availability and ridership has a direct benefit to reducing GHG and managing congestion by reducing the number of overall vehicles on the road.
Transit and Intelligent Transportation Systems in Anchorage

Anchorage’s People Mover system has implemented a number of Intelligent Transportation Systems (ITS) in the past five years. Scheduling and dispatching systems, bus schedule information via a 24-hour telephone system, and most significantly, TransitRealTime provides the actual time a bus will arrive at a bus stop via the internet and by signs at major bus stops. This technology is being implemented to enhance the reliability, predictability and attractiveness of transit services for existing and potential bus riders.

Ridesharing in Anchorage

Ridesharing is a program that provides car/van pool matching services for residents in Anchorage and its commute area. Its primary objective is to encourage and support alternatives to Single Occupant Vehicle (SOV)-driver commuting by coordinating with employers, disseminating information and sponsoring vanpool services and proving rideshare matching services.

The existing significant need in addressing ridesharing is the commuting traffic between the Mat-Su and Anchorage. Currently, 700 residents travel in 49 vanpools between Mat-Su and Anchorage and in 3 vanpools between Anchorage and Girdwood. Park and ride lots are full and the waiting list to enroll in the vanpool program is over 700 residents strong. The lack of vans that are used in the rideshare program is the largest obstacle. Anchorage and the Mat-Su are working to solve this need hopefully with some financial support for the legislature in the coming sessions.

Statewide Actions

The recently approved (September 2008) Governor’s Coordinated Transportation Task Force (Administrative Order #243), is an important step in advocacy for transit improvements.

Types(s) of GHG Reductions

TBD

Estimated GHG Reductions and Net Costs or Cost Savings

<td>TBD</td>
<td>TBD</td>
</tr>
</tbody>
</table>

Data Sources:

- Transit and Vanpool Ridership and Passenger Miles Traveled in Anchorage and Fairbanks: National Transit Database, 2006

Quantification Methods:
• Passenger miles traveled (PMT) in transit and vanpool vehicles was assumed to double, along with ridership, by 2025

• PMT was multiplied by the mode shift factor to determine the number of vehicle miles traveled (VMT) displaced by transit and vanpool ridership

• The increase in VMT displaced in each year was multiplied by standard emissions factors to arrive at GHG reductions

• Note: the current calculation does not account for increased emissions from new transit vehicles. Once these emissions are taken into account, estimated GHG reductions will be lower.

Key Assumptions: Ridership increase begins in 2010 and rises steadily to 2025.

Key Uncertainties

The appropriate mode shift factor for the proposed transit and vanpool expansions may be higher than estimated in APTA guidance. The guidance estimates that only one third of transit trips would have been made in a unique vehicle trip if no transit were available. Commute trips on transit are more likely to replace a single-occupancy vehicle (SOV) trip than non-commute trips.

Additional Benefits and Costs

Transit expansion in urban areas can facilitate more compact development patterns and help reduce roadway congestion. Both of these benefits produce additional reductions in GHG emissions.

Feasibility Issues

Level of Group Support

TBD – [until CCMAG moves to final agreement]

Barriers to Consensus

TBD – [undetermined until final vote by the CCMAG]
T-2. Heavy-duty Vehicle Idling Regulations and/or Alternatives

Policy Description

Alaska will focus on reducing idling times for diesel and gasoline heavy-duty vehicles, buses, and other vehicles through a combination of statewide anti-idling regulations and by promoting and expanding the use of technologies that reduce heavy-duty vehicle idling. These technologies include vehicle equipment modifications such as auxiliary power units, direct fired heaters, and automatic engine shut down/startup system controls. Other effective means of idle reduction come through the use of Intelligent Transportation Systems (ITS) technology such as electronic weigh station bypass systems. These systems allow safe and legal vehicles to pass a weigh station, at highway speed, without stopping for inspection. This bypass eliminates the need for a heavy duty vehicle to idle its engine for a period from as few as 10 minutes to as many as 60-90 minutes.

Recognizing Alaska’s severe arctic and sub-arctic winter conditions, accommodations must be made for below zero winter temperatures. Auxiliary power units, for example, can ameliorate the effects of idling but idling cannot be entirely prohibited such as when extreme weather conditions warrant.

Alaska will encourage the adoption of statewide statutes or regulations and local ordinances to promote idle reduction for all vehicles. All vehicle owners, public and private will be subject to these regulations and to the penalties prescribed in the statute or regulations.

Policy Design

Alaska will develop and implement a statewide regulation banning extended idling by heavy-duty vehicles given accommodations for below zero arctic and sub arctic winter conditions. As with all regulations, they must be enforceable with a reasonable expectation of penalty for non-compliance. Alaska will also provide local governmental units with model language for adoption as local anti-idling ordinances.

Alaska will encourage and promote reduced idling through programs aimed at increasing voluntary adoption of idling reduction technologies. Components of such an effort should include collaborative outreach and education timed with the implementation and enforcement of a statewide anti-idling regulation and seeking funding for pilot projects and demonstrations as well as funds available though any federal or other programs to evaluate the effectiveness of various idle reduction technologies.

Alaska may also provide additional incentives to fleet or individual heavy truck owners to purchase and install idle reduction technologies on their vehicles. These incentives may come in the form of full grants, matching grants, tax credits and low or no interest loans.
Alaska may also provide incentives to assist the private fleets to convert some of their vehicles to hybrid operation. Such engine technology is or soon will become available in the marketplace.

**Goals:**

- Alaska DOT&PF will lead by example with the installation of idle reduction technology and/or idle reduction policies/procedures for its fleet of heavy duty vehicles. This goal will be phased to accomplish installation of these technologies or adoption of policies; 20% will be so equipped by 2012 with the remaining 80% equipped by 2020, with exception for vehicles used only seasonally.

- Local governments and school districts will install idle reduction for their fleets at a rate similar or slightly lagging the state DOT&PF.

- Commercial and private fleets will be encouraged through regulation and through incentives to meet the same timetables.

- The Alaska DEC will be the lead agency to adopt and enforce the statute or regulations on both public and private vehicle owners.

- Accomplishment of these goals should result in significant reductions in both green house gas emissions and should also show significant fuel savings.

**Timing:**

- Target date for the development and implementation of anti idling regulations for state and local governments is the end of 2011. Legislation can be introduced in the 2010 session of the Alaska Legislature to establish the statutory authority to require that regulations and local ordinances be adopted to implement these requirements.

- Target date for partial and full implementation of idle reduction technologies by all parties is 20% by 2012 and the remaining 80% by 2020, with exception for vehicles used only seasonally.

**Parties Involved:** Alaska Departments of Commerce and Community Development, Transportation and Public Facilities, Environmental Conservation, Revenue, local governments, school districts, commercial and private truck fleets, tour bus operators, trucking associations, unions, shippers, Metropolitan Planning Organizations (MPO) including FMATS and AMATS.

**Implementation Mechanisms**

*TBD – [CCS drafts based on TWG inputs; this can be developed as they go along, and can start early or late as they prefer; the level of detail can vary on TWG approval]*

**Related Policies/Programs in Place**

U.S. EPA-approved idling reduction devices are excluded from the 12% federal excise tax (FET) under Section 206 of the Energy Improvement and Extension Act of 2008 (EIEA) (PL 110-343). EPA has published a complete list of idling reduction devices that are eligible for the retail excise tax exemption. The types of idling reduction devices include fuel operated heaters, battery air conditioning systems, auxiliary power units/generator sets, thermal storage systems, and shore connection systems. The complete list of EPA approved idling reduction devices can be found at: [www.epa.gov/smartway/transport/what-smartway/idling-reduction-fet.htm](http://www.epa.gov/smartway/transport/what-smartway/idling-reduction-fet.htm)

<td>0.085</td>
</tr>
</tbody>
</table>

Data Sources:

Quantification Methods:
- Highway Statistics provides limited data on heavy duty truck populations in Alaska. Vehicle population estimates will be refined upon receipt of data from the Alaska Department of Motor Vehicles. Currently, the total population of state and local government-owned and private and commercial heavy duty trucks in Alaska is estimated as follows: The proportion of single-unit heavy duty trucks out of all trucks was assumed equal to the proportion of combination heavy duty trucks (truck tractors) out of all trucks. The proportion of government owned heavy duty trucks out of all government owned trucks was assumed equal to the proportion of privately owned heavy duty trucks out of all privately owned trucks.
- Population of heavy duty trucks in future years was estimated to increase proportional to the population of the state until 2025.
- Hours of idling reduced was calculated from assumed total hours of idling, target penetration rates, and assumed policy effectiveness. Fuel savings and emission reductions were calculated based on hours of idling reduced.

Key Assumptions:
- Buses and heavy duty trucks idle an average of 312 hours per year each. (Assumption from Puget Sound Clean Air Agency and Washington State Department of Ecology. Consistent with estimates from California Air Resources Board.)
- There is no substantial overnight idling of long-haul vehicles in Alaska
- 25% of idling can be reduced by vehicles installing anti-idling technologies or complying with new regulations
- 20% of vehicles will be compliant by 2012. 100% of vehicles will be compliant by 2020. Reductions begin in 2011.
Key Uncertainties

T-3. Transportation System Management

Policy Description

The State of Alaska would seek to reduce GHG emissions from the transportation sector through improvements to transportation system management. These efforts would focus on the improvement, management, and operation of the transportation infrastructure, with a focus on the roads and highway systems.

Policy Design

- Roundabouts can reduce traffic queuing and delay, thus saving fuel and reducing GHG emissions; they also have safety benefits. ADOT&PF will encourage the installation of roundabouts.
- To improve fuel economy and reduce GHG emissions per mile traveled, the state will reduce maximum speed limits on state highways to 60 MPH, or lower where appropriate. Additional benefits are reduced traffic injuries and fatalities.
- ADOT&PF will continue its commitment to providing a multimodal transportation system by continuing to invest in transit, bike and pedestrian facilities. ADOT&PF spends an average of roughly $5 million annually on these facilities and expects this level of commitment to continue or increase.
- All urban areas (i.e., >5,000 population) will continue to include consideration of bike and pedestrian facilities in their urban transportation plans.
- ADOT&PF in partnership with urban communities will work to improve traffic signal synchronization on all state managed routes (mostly arterials) in urban areas (i.e., >5,000 population) by 2012. Signal synchronization reduces start/stop traffic on arterial routes as the lights are timed to continuously move traffic forward at the target pace. This strategy also helps reduce traffic queuing thus saving fuel and reducing GHG emissions.
- ADOT&PF will complete conversion of all traffic lights to LED bulbs by 2010 and will work with cities to convert roadway luminary lighting under city jurisdiction. LED bulbs significantly conserve energy thereby indirectly reducing GHG emissions.
- All urban transportation plans will be updated by 2012 with an emphasis on operations and safety. The operations elements in urban transportation plans will improve traffic flow, reduce conflict points and can result in turn lanes, reconfiguration of intersections or access control. In metropolitan areas, the transportation plans will meet air quality conformity requirements for criteria pollutants.
- Congestion management plans for all high traffic volume construction projects will be considered by ADOT&PF. These plans implement strategies to keep traffic flowing through construction zones, thus reducing fuel use and reducing GHG emissions.
• Access management will continue to be pursued consistent with state of Alaska statutes and ADOT&PF policies. Access management is intended to reduce the number of street and driveway access points to major roads and highways, in order to reduce conflict points. It has a proven capacity and safety benefit. The appropriate goal is to continue and strengthen access management within the state.

• Install traffic management technologies and provide public information of travel conditions on high volume commuter routes, especially those lacking practical bypasses. ADOT&PF along with partner communities will complete by 2010 a comprehensive ITS Plan for the Glenn Highway corridor between Anchorage and the Mat-Su valley.

• Improve the manner in which incidents and accidents on high volume routes are processed. Require drivers involved in crashes to pull away from travel lanes. Implementation will require educational signs, and possibly a statutory change requiring moving vehicles to the side of a road in non-injury accidents. Accelerate accident scene processing following the Washington state model (faster accident scene clean-up, faster documentation of scene evidence, while not compromising investigation of facts); this may require some trial deployment and testing of the new approach in the courts.

Goals: See above.

Timing: See above.

Parties Involved: ADOT&PF, FMATS and AMATS, local governments

Implementation Mechanisms

Roundabouts. ADOT&PF, FMATS and AMATS should evaluate potential intersection locations for roundabout installation. ADOT&PF will report on its roundabout evaluation criteria and list all locations evaluated annually for potential roundabout installation, to be no less than 5 intersections/locations annually. ADOT&PF will encourage the installation of roundabouts when the installation is based on sound engineering principles. ADOT&PF will work cooperatively with local governments seeking information on the principles of roundabout installation. ADOT&PF will assist the cities and boroughs in their analysis of roundabout suitability for intersections under their jurisdiction. ADOT&PF will consider roundabout treatment at planned right angle intersections for new construction and upgrades and when completing routine safety reviews. ADOT&PF has previously adopted roundabouts in the 2007 Strategic Highway Safety Plan as a preferred solution, where practicable, for safety reasons.

ITS Plan. Routes such as the Glenn Highway between Anchorage and the Mat-Su valley experience considerable traffic during peak conditions. Due to a lack of alternative routes, incidents such as accidents and spilled loads can tie up traffic for hours. ADOT&PF along with partner communities will strive to complete by 2010 a comprehensive ITS Plan for the corridor that would evaluate and prioritize:

• Installation of speed and congestion sensors
• Installation of internet accessible cameras
• Use these technologies to monitor conditions, respond to incidents and inform the public of incidents and congestion
• Use all available means of communication, including radio, email/text message, Variable Message Signs, Highway Advisory Radio and internet media.
• Deploy (perhaps on a trial basis) courtesy patrols which can respond to breakdowns, out of fuel, flat tire, accident scenes.
• Capture better data on incidents so that progress can be evaluated (e.g., benefit-cost)

**Related Policies/Programs in Place**

**LED Lights.** To improve energy efficiency of traffic signal and roadway lighting, several efforts are underway in Anchorage. The Municipality has already installed LED lights in all of its traffic signals to reduce energy costs. It’s estimated that energy cost for traffic signals alone is about a 30% savings. In addition, the Municipality is reviewing all outdoor lighting, which includes over 16,000 streetlights as well as pedestrian lighting, parking garage lighting, and trail lighting. Streetlights currently utilize a 150W to 400W High Pressure Sodium (HPS) fixture, which operate approximately 4,400 hours per year at an annual energy cost of $2.2 Million. It’s also possible to reduce the load or wattage of the street lights and/or provide dimming devices for greater energy and cost savings.

As of December 2008, Anchorage has finalized design criteria for low-speed, residential street lighting and is installing over 4,000 LED fixtures in neighborhoods throughout the city. The Municipality is undergoing testing of LED fixtures for higher speed roadways and hopes to finalize criteria for this application in 2009.

The quality, amount, brightness, glare, and uniformity of lighting are all key elements in the effort for better and lower cost lighting. In addition to cost and energy savings, lighting can also provide a better color of light (white instead of orange or blue), enhanced safety through improved visibility, less light trespass into homes, and less light pollution into the night sky. The effort to minimize operational maintenance cost is a significant benefit. The LED fixtures being installed in Anchorage use 50% of the energy of HPS fixtures, and the lamps last roughly five to seven times as long.

**Transit Improvements.** The recently approved (September 2008) Governor’s Coordinated Transportation Task Force (Administrative Order #243), is an important step in advocacy for transit improvements.

**Types(s) of GHG Reductions**

*TBD*

**Estimated GHG Reductions and Net Costs or Cost Savings**

Partial Quantification Only Based on Reduced Speed Limits:

<td>0.078</td>
<td>TBD</td>
</tr>
</tbody>
</table>

**Data Sources:**

Alaska Climate Change Mitigation Advisory Group 12 Center for Climate Strategies www.akclimatechange.us www.climatestrategies.us
• Speed limits, average vehicle speeds, and daily traffic counts on Alaska state highways from ADOT&PF
• VMT from the Alaska GHG Inventory and Projections.

Quantification Methods:
• We calculate VMT for each future year for affected highways using data on VMT by vehicle and facility type from FHWA and projections of VMT for Alaska. VMT on routes currently posted at 65 MPH is assumed to increase proportionally with total statewide VMT.
• We calculate improvements in fuel economy for affected vehicles based on assumptions below.
• We calculate the reduction in CO₂ emissions from the improved fuel economy of targeted vehicles. Cumulative reductions are calculated beginning in 2010.

Key Assumptions:
• Reducing the speed limit from 65 to 60 MPH will cause 25% of vehicles to reduce their speed by 5 MPH.
• Each 1-mph reduction of speed from 70 mph to 55 mph yields a fuel economy increase of 0.1 mpg for heavy-duty diesel trucks (EPA).
• Each 1-mph reduction of speed down to 55 mph yields a 1% reduction in CO₂ emissions per mile (Dierkers et al.).

Key Uncertainties
TBD – [as needed and approved by the TWGs]

Additional Benefits and Costs
TBD – [as needed and approved by the TWGs]

Feasibility Issues
TBD – [as needed and approved by the TWGs]

Status of Group Approval
TBD – [until CCMAG moves to final agreement]
Level of Group Support

TBD – [until CCMAG moves to final agreement]

Barriers to Consensus

TBD – [undetermined until final vote by the CCMAG]
Policy Description

GHG emission reduction through efficient, sustainable (i.e., smart growth) land development patterns will need to be incorporated with reduced VMT, transit improvements, sustained implementation of multi modal links to facilitate biking, walking, and winter trail use in residential and urban areas.

Issues and items to be developed would include:

- State policy issues detailing funding parameters and funders’ policies distributing state and fed dollars
- Changes to state laws and regulations
- Local development plans i.e. Anchorage 2020, FNSB Regional Comprehensive Plan
- Local zoning code changes
- Increased urban / residential density factors
- Land “disposal” sales and auctions, including UA and AMHLT
- Subdivision codes and standards to set aside people friendly open spaces, green belt reserves
- Tax credits / incentives to developers
- Must be combined with infrastructure planning – roads and utilities

Public buy-in is a must. There must be strong incentives to have people accept programs.

Policy Design

This option will focus on promoting land use changes that result in higher densities in developed, urban areas. It will also focus on incorporating retail zones and small limited commercial nodes in residential developments, with a goal of reducing driving needs by facilitating walking or bicycling. Changes to residential development patterns, including new subdivisions around population centers, will require a full gambit of incentives to produce the desired change. Efforts to promote land use changes should be coordinated with the Alaska Municipal League.

The Department of Education will require school boards in selecting new school sites to favor sites which can be reached by walking and biking for the majority of the population the school will serve. Travel of school children by parent-driven vehicles is widely practiced, and is considered a major component in traffic volumes due peak periods. The benefits of walking and bike riding to schools include not only reduced vehicular fuel consumption and GHG emissions but also a more physically fit youth population.
Goals: By 2020, at least 50% of Alaska’s annual new residential and commercial construction should occur within the denser parts of urban areas through re-development, infill, and mixed uses that take advance of the existing public investment in infrastructure, public services, and facilities.

Note that implementation of this strategy may be affected by new federal regulations on metropolitan transportation planning and GHG reduction.

Timing: See above.

Parties Involved: State and local governments, developers, transit agencies, Alaska Municipal League, Alaska DOT&PF, MPOs

Implementation Mechanisms

T-5. Promotion of Alternative Fuel Vehicles

Policy Description

Alternative fuel vehicles (AFVs) offer significant opportunities to reduce greenhouse gas emissions from the light-duty fleet. Alternative fuels include natural gas, propane, bio-diesel, electricity, ethanol, hydrogen, and fuel cells. AFVs include hybrid vehicles that utilize more than one power source to move the vehicle. Because of Alaska’s large deposits of natural gas, compressed natural gas (CNG) vehicles may be a particularly viable option for the state. However, questions remain about the feasibility and benefits of CNG vehicles in Alaska.

This mitigation option consists of two parts. The first part is working towards the replacement of existing light-duty vehicle fleets with AFVs. The second part consists of better informing the public of the benefits of purchasing AFVs and providing incentives as well.

Public sector agencies¹ and some private sector firms own a large number of vehicles. Converting these fleets to AFVs can result in large reductions of pollutants and greenhouse gases.

The second component of this proposed policy consists of providing information to consumers about benefits of AFVs, such as fuel efficiency benefits, environmental (cleaner air) benefits, cost savings, and technological benefits.

The policy would be implemented through a series of federal and state supported low-cost loans, grants, attractive financing of trade-in, tax incentives, other incentives and subsidies, to promote use of AFVs.

Policy Design

Goals:

- Increase the use of light-duty AFVs by public sector agencies and private sector firms to 25% of on-road fuel consumption by 2020 and 35% by 2030.
- Increase the use of AFVs by consumers to 10% of on-road fuel consumption by 2020 and 25% by 2030.
- State support for analysis of life-cycle GHG benefits of alternative fuels in the Alaska context.

Timing: See above.

Parties Involved:

Affected: Government at all levels; other fleets

Implementers: Government, military.

¹ Public sector agencies include: federal, state, and local governments; school districts, and utilities.
Implementation Mechanisms

State legislation should authorize tax incentives for public sector fleet conversions by 2012.

State legislation should authorize financing (2% loans) for AFV purchases by 2012.

State legislation should create a rebate program to encourage consumer purchases of AFVs.

The state should also encourage conversion of gasoline vehicles to CNG in appropriate situations. The U.S. Congress has encouraged conversion of cars to CNG with tax credits of up to 50% of the auto conversion cost and the CNG home filling station cost. However, while CNG is a much cleaner fuel, the conversion can only be performed by manufacturers certified to perform aftermarket conversions on vehicles to operate on alternative fuels. There do not appear to be any certified manufacturers for conversion in Alaska. One challenge preventing more widespread conversion of standard engines to operate on alternative fuels is the high cost associated with becoming certified to perform the conversion; meeting the requirements of a type certificate can cost up to $50,000.

Related Policies/Programs in Place

TBD – No recent policies or programs have been identified as of yet. The TWG and DEC can work with CCS to identify existing or planned programs that address issues raised in this option.

Types(s) of GHG Reductions

Data Sources:

- GHG reduction factors from alternative fuels from the GREET model v1.8
- Electricity generation mix in Alaska from EPA’s eGRID 2007
- VMT forecasts from the Alaska GHG Inventory and Forecast
- Vehicle fleet data from Highway Statistics 2006 (Table VM-1)

Quantification Methods:

We tested three possible scenarios for compliance with the AFV goals:

1. 100% of AFV run on compressed natural gas for 100% of mileage
2. 100% of AFV are electric vehicles
3. 100% of AFV are plug-in hybrid electric vehicles (PHEV)
The table below show lifecycle (well-to-wheels) GHG emissions per mile for automobiles, calculated using GREET v1.8. These figures take into account Alaska’s electricity generation mix.

T-6. VMT and GHG Reduction Goals in Planning

Policy Description

Transportation Planning has historically focused on meeting the user demands for transportation, reacting primarily to changes in population growth, land use and other demands such as freight or resource movements. In many respects, the profession has been reactive or passive to these other considerations. Transportation planning generally evaluates tradeoffs of agency cost, travel time and user costs. The idea of using Planning as a means of reducing both the number of miles driven, and the production of green house gases is the cornerstone of this option. By empowering transportation planners to evaluate alternative proposals on the basis of VMT and/or GHG generation, decision makers can further improve the organization of communities so as to reduce the impacts of transportation on the environment.

It is important that personal mobility be retained as a paramount goal. Such mobility is a hallmark of modern society, for it empowers people to live, work, shop, play and go to school at locations they choose rather than those for which no other alternative exists due to lack of mobility. Historically in the U.S., VMT has risen much faster than population including a 3:1 ratio in Alaska since statehood. Thus any policy that attempts to reduce the per capita VMT and GHG production must be carefully tailored and include follow-up monitoring during implementation, to ensure it does not put a drag on the economy. Moreover, the real goal of this policy should focus on emissions reductions, even if VMT is unfettered. The fact that VMT can occur without emissions, depending upon the means of propulsion, suggests the ultimate goal should be on the form of energy and not the use of vehicles.

Unlike other states, where highway travel is the predominant source of transportation emissions, in Alaska the predominant emissions source is aviation, with highways a distant second. Thus, many Alaska communities are limited in their mobility options, relying solely on aviation and seasonal barge deliveries of freight and fuel. Nearly 30% of the state’s population is limited in their mobility options, and any analysis must consider these circumstances. Currently, due to high energy costs, villages are experiencing out-migration to Alaska’s cities, where employment is more readily found and the cost of living lower. This will increase per capita VMT within the state, as a cohort of the population is moving into the ranks of drivers.

Transportation planning is one tool to better inform decision makers. Many important decisions affecting vehicle miles traveled are made by various other entities. For example, the decision made in siting a new school may make busing and/or driving by parents the unavoidable option for pupil transport. Yet, seldom is this even considered by school boards when they make decisions for new school locations. When a new school is sited where walking and biking is not safe or practical it results in millions of vehicle trips being necessary over the long life of the school. This is but one example of how TLU-6 can help inform decision makers of the transportation consequences of their decisions.
Policy Design

Greenhouse Gases (GHG)

Calculating CO2 emissions associated with an individual transportation project is not straightforward. The analysis can be quite complicated as most projects form but one piece of a larger network. Transportation planner’s models do not generally predict the land use, induced demand, changes in speed and fleet that will occur during the project life nor travel characteristics of the user population. For example, phenomenon such as trip linking or what has happened in modern Alaska, when a large cohort of young people that arrived in the 1970’s later age and thus have fewer children at home and follow a different life style, are generally not considered in even today’s most sophisticated models.

However, whether adopted by the state, or later mandated under federal law, the requirement to predict the GHG emissions of any given project, including all considered alternatives, is likely to become a requirement soon.

Goals: All significant transportation system plans developed at the state and MPO level, and all actions that would change or provide a new mode of transportation or enlarge capacity would be required to have an evaluation of their contribution to GHG emissions. Currently, traffic models to assist in such evaluations exist only at the metropolitan level in Alaska, and thus time may be needed to develop tools for non-metropolitan areas.

Timing: The two MPOs (FMATS and AMATS) would work with ADOT&PF to start developing consistent methods to evaluate GHG from transportation system plans, and relevant projects by the end of 2010.

Parties Involved: ADOT&PF, FMATS, and AMATS

Vehicle Miles of Travel (VMT)

Goals:

- Support and promote public and private planning and development practices, including smart growth planning (see TLU-4) and infrastructure provisions, including expanded opportunities for non-vehicular travel that reduce the number and/or length of trips made in Alaska.

- By 2015, reduce the per-capita light-duty vehicle miles traveled (VMT) by 1% in communities that offer transit services and 3% by 2025.

Timing: See above.

Parties Involved: Alaska Department of Transportation and Public Facilities (ADOT&PF), Fairbanks Metropolitan Area Transportation Solutions (FMATS), Anchorage Metropolitan Area Transportation Solutions (AMATS)

---

2 The Ninth Circuit which includes Alaska recently held that federal agencies must assess climate change impacts in environmental documents prepared under NEPA (9th Cir., November 15, 2007).

</table>

Data Sources:

- Statewide VMT projections from Alaska GHG Inventory and Forecast
- Population forecasts for Alaska and Alaska urban regions: Alaska Economic Outlook, October 2007

Quantification Methods:

- VMT in the Anchorage and Fairbanks regions was projected based on assumptions below
- VMT reduction in Anchorage and Fairbanks was estimated based on stated goals.

Key Assumptions:

- VMT per capita in the Anchorage/Mat-Su region and the Fairbanks region is assumed equal to statewide VMT per capita. (This assumption will be updated with data from FMATS and AMATS).

Key Uncertainties

The goal of limiting the per-capita use of light duty vehicles by 1%, then 3% by 2015 and 2020 respectively may be considered short of a “stretch goal” by some observers. Further, as written, the goal exempts heavy vehicle VMT, and further exempts communities that lack transit systems. However, the Alaska circumstance is so significantly different, the following factors are put forward to justify this seemingly “soft” goal.

- Gas Line Construction: Alaska is facing the construction of one and possibly two major pipelines in the coming decade which will substantially amplify the economy and the
number of trips being made, since most of the line’s construction lies beyond the reach of transit, walking or biking. The larger gas line project will be the largest private sector construction project in North America history, and it will have a material impact on VMT.

- Migration to other modes: Alaskans rely extensively on aviation as a means of travel, and in some cases, where possible, their travel mode of choice may be changed to highway travel. Since highway travel is often less fuel intensive than is aviation, this is a good outcome for GHG production, even if it results in increased VMT.

- Not including heavy vehicles trips in the goal: Much of Alaska’s reliance on freight and construction vehicles (non light-duty) is related to oil and gas industry or other resource production. Including these types of trips in any goal, is not realistic, since there are very limited options for such freight and equipment movements.

- Historic pattern of VMT growth: Alaska has seen its VMT measure increase by about 300% as compared to population. This is higher than in the United States where a growth ratio of 2.5 has been observed. Yet nearly 30% of Alaskans cannot drive beyond the confines of their community due to an incomplete road network, and thus the actual ratio might have been higher if more roads were available. In a state larger than Texas, Montana and California combined, long distance travel is sometimes unavoidable, and thus any goal must keep this in mind.

- Land Use Changes are Slow Moving: Once developed, land use is relatively fixed, and thus the pattern of vehicle use from these locations is not easily addressed by transportation planners. Examples include the practice of large lot subdivisions within the rapidly growing Mat-Su area, the hillside development in south Anchorage, or residential land development outside the Fairbanks bowl area that requires 20 to 50 mile round trip. Encouraging walking and biking to schools that are miles from their pupils is another example of prior decisions that lock in vehicle use, for many more years into the future.

- Alternatives May Not Exist: If a community is too small or too spread out for transit and walking, what choices are there for residents, but to drive as they do today? Many of Alaska’s communities are not likely to see transit systems in the foreseeable future. The van ride sharing options become the primary methods to reduce SOV driving. Thus any VMT reduction goal in such communities is not founded in reality.

T-7. On-Road Heavy-Duty Vehicle Efficiency Improvements

**Policy Description**

The State of Alaska should create new services and add additional support to existing voluntary and incentive-based programs that help public and private on-road heavy-duty diesel powered fleets reduce GHG emissions.

**Policy Design**

This policy employs a combination of three primary strategies to achieve GHG emission reductions. The three strategies are:

1. Develop incentives to encourage public and private on road diesel fleets to participate in the Federal EPA Smart Way® Transport Partnership Program.
   
   **Goal** – Achieve public and private fleet participation in Smart Way of 30% of total trucks in Alaska by 2012 and to 50% by 2020.

2. Provide incentives to phase out “old” (1988 and older) high GHG emitting on-road heavy-duty diesel engines and replace them with modern lower GHG emitting diesel engines if appropriate.
   
   **Goal** - Phase out 50% of “old” (1988 and older) high GHG emitting on-road heavy-duty diesel engines by 2015.

3. Develop incentives for state, borough and municipal government managed vehicle fleets to develop and implement plans to reduce GHG emissions from their public transit, school bus and maintenance vehicles. Examples could include idling reduction strategies, alternatively powered engines; i.e. LNG, NG, electric, hybrid, resource sharing etc.
   
   **Goal** - Achieve a minimum 20% GHG emission reduction from 2008 benchmark by 2020.

**Timing:** Immediate, no need to wait.

**Parties Involved:** Alaska Departments of Environmental Conservation, Transportation and Public Facilities, Municipal and local governments, Alaska Railroad, Alaska Trucking Association, public and private partners, local and statewide businesses, several not-for-profit organizations.

**Implementation Mechanisms**

T-8. Marine Vessel Efficiency Improvements

**Policy Description**

Actions by the State can promote efficiencies and conservation options for commercial fishing, recreational fishing, marine tourism, and other forms of marine transportation.

Because Alaska’s commercial fishing economy powers most coastal communities and provides employment levels higher than any other private industry in the state, it is critical to mitigate GHG emissions from the sector as a way to assure continued commercial fishing activities. Registration information available from the State of Alaska through the Commercial Fisheries Entry Commission (CFEC) for 2007 shows that there are 9,695 registered Alaska commercial fishing vessels, including 6,028 diesel and 3,510 gasoline vessels, with 1981 as the average year of construction and a mean horsepower rating of 311. While the vessel registrations range from 2-cycle gasoline powered outboard skiffs to sophisticated factory ships, the larger vessels are more likely to be newer and have operational plans that include engine and hull efficiency improvements. The medium and small vessels that typically operate seasonally are more likely to need government assistance to encourage installation of more fuel efficient engines.

There may also be efficiency gains and resulting GHG reductions available to the commercial fishing fleets relating to season openings, closings, and conduct through regulatory adjustments and coordination with freight transportation systems. GHG reductions may also be possible through development of regulations that minimize travel requirements for all fisheries, commercial, commercial sport, recreational, personal use or subsistence.

Charter vessels (4,097 as of 2004) are generally less than 50 feet and are likely to have similar issues to the small and medium vessels in the commercial fleet; information on the fleet’s make-up is not as readily available. Determining the nature of the recreational fleet and issues relating to fuel efficiency is more problematic. Larger vessels such as cruise ships and ferries would typically have sophisticated operational plans that consider fuel efficiency issues with government oversight well established.

**Policy Design**

The basic policy recommendation for promoting installation of more fuel efficient engines or hull design is to provide financial incentives such as low-cost loans that would encourage vessel owners to implement changes without unduly compromising industry economics. For the Alaska resident commercial fleet, the state’s Department of Commerce, Community and Economic Develop (DOCCED) already has a commercial fishery revolving loan fund that could be further altered to allow for targeting energy efficiency improvements. For the out-of-state residents, options include a Department of Energy loan program or inclusion of fishermen in equipment upgrade programs set up for farmers under the Department of Agriculture. Charter and recreational vessels are currently not eligible under the DOCCED program and need an alternate avenue for financial assistance.
Efficiency improvements relating to conduct of a given commercial, commercial sport (charter), recreational, personal use or subsistence fishery are regulatory in nature and would require action by the Alaska Board of Fisheries (BOF). Currently, there are no BOF criteria specifically relating to efficiency or GHG emissions other than cost considerations. A policy requiring the BOF to consider energy efficiency when setting regulations would not require any funding or subsidy, but would allow the BOF to at least consider GHG emissions.

**Goals:**

- Provide financial incentives to accelerate replacement of marine vessel engines such that, by 2020, no more than 50% will be pre-2000 engines. *(EPA’s Tier 1 standards for marine engines took effect in 2000).*
- Encourage federal and state agencies that regulate commercial fishing to consider GHG emissions when making policy decisions.

**Timing:** See above.

**Parties Involved:** Alaska Department of Commerce, Community and Economic Develop (DOCCED); Alaska Department of Energy; Alaska Board of Fisheries (BOF); Alaska State Legislature; Alaska Dept of Fish and Game; US Dept. of Energy; US Dept. of Agriculture

**Implementation Mechanisms**

For the Alaska resident commercial fleet, expand the Alaska Department of Commerce, Community and Economic Develop (DOCCED) commercial fishery revolving loan fund to targeting energy efficiency improvements. This could involve lowering the interest rate for vessel improvements that improve fuel efficiency. *(May be unnecessary if current HB 20 is signed.)*

For the out-of-state residents, encourage development of a U.S. Department of Energy loan program that could target commercial marine vessels. Also encourage inclusion of fishermen in equipment upgrade programs set up for farmers under the Department of Agriculture.

For charter and recreational vessels, which are currently not eligible under the DOCCED program, develop a new state program to encourage energy efficiency improvement.

In order to develop regulations can reduce GHG footprint of fisheries in Alaska; a policy that requires the Board of Fish to consider energy efficiency into account for commercial, commercial sport (charter), recreational, personal use and subsistence fisheries. The Alaska Department of Fish and Game also needs direction to manage fisheries in a way that can accommodate GHG reductions.

**Related Policies/Programs in Place**

*TBD – No recent policies or programs have been identified as of yet. The TWG and DEC can work with CCS to identify existing or planned programs that address issues raised in this option.*

<td>TBD</td>
</tr>
</tbody>
</table>

**Data Sources:**

- Vessel age distributions from Alaska Commercial Fisheries Entry Commission, Permit Holder Database (2008)
- GHG emissions from marine vessels from the Alaska GHG Inventory and Forecast

**Quantification Methods:**

- GHG emissions from fishing vessels were estimated based on the Alaska GHG Inventory and Forecast and activity data from the commercial marine inventory.
- The quantification method uses vessel age as a proxy for engine age; we are not aware of any data on the actual age of operating marine engines. We calculated the percentage of vessels that are 20 years old or older using data from the Permit Holder Database. Approximately 2/3 of vessels in 2008 are 20+ years old.
- We assume that the age distribution of vessels will remain constant in future years. We calculated the percentage of vessel engines that should be replaced by the incentive by 2020 in order to attain the goal of no more than 50% pre-2000 engines. We assume that vessels taking advantage of the incentives have average fuel use and GHG emissions. For engines affected by the turnover incentives, we applied an emission reduction of 4%, according to assumptions below.
- Note that the use of vessel age as a proxy for engine age overstates the benefits of this policy, since many older vessels will already have replaced their original engines.

**Key Assumptions:**

- EPA Tier 1 marine engines improve fuel efficiency by around 4% (estimate from Gordon Gerber, Caterpillar)

**Key Uncertainties**

T-9. Aviation Emission Reductions

Policy Description

In addressing GHG emissions from the aviation sector, the State of Alaska must take into account its unique interests in the sector, the policies and practices of other states and territories, and other national and international laws and policies affecting aviation and environmental goals.

Aviation plays a critical role in the Alaskan economy and society. Its location on the great circle routes connecting Asia, North America and Europe, affords the State a vital role and unique opportunities within the international aviation system. At the intrastate level, vast distances between population centers and relatively underdeveloped infrastructure supporting other transportation modes require the State to rely more on intrastate aviation than other jurisdictions. Alaskan policy must take in account and protect these unique interests.

At the same time, both commercial air transportation and the climate change challenge are manifestly global in character. These factors intensify the need to calibrate policies carefully to ensure they do not merely deter or deflect economically beneficial aircraft operations (and associated emissions) to other jurisdictions.

Climate change policy also must account for and operate within the long-standing and complex frameworks of environmental and aviation policies. In the environmental sphere, Alaska has the responsibility to meet National Ambient Air Quality Standards for criteria pollutants such as particulate matter and carbon monoxide – recognizing that many measures aimed at reducing GHG emissions could have the co-benefit of reducing criteria pollutant emissions, policies should allocate limited resources accordingly. Similarly, aviation is subject to comprehensive Federal regulation designed to ensure safety and maximize the availability of affordable air transportation services throughout the country. State and local authority to directly regulate air carrier operations is necessarily limited by that framework and Alaska, like other states, must calibrate policies accordingly.

This mitigation option includes three components:

- Support Modernization of the Air Traffic Management System
- Operational Measures
- Alternative Fuels for Aviation

Policy Design

Support Modernization of the Air Traffic Management System

Support the Federal Aviation Administration (FAA) in the redesign and improvement of the existing, out-dated, air traffic management (ATM) system through the implementation of the Next Generation Air Transportation System project (NextGen). Implementation of NextGen, which will include enhanced communications, navigation and surveillance, will reduce air traffic
delays and shorten routes resulting in a more efficient National Airspace System with a significant reduction in GHG emissions. According to FAA, full implementation of NextGen has the potential to reduce greenhouse gas emissions by between 10 and 15 percent. The State of Alaska will take measures to support the implementation of NextGen and document the associated emissions reductions.

**Goals:**

- Identify opportunities to assist FAA’s implementation of NextGen
  - Advocate for implementation of NextGen in the United States Congress
  - Identify state-specific actions that will assist with the timely implementation of NextGen.

- Determine potential GHG emissions reductions in Alaska resulting from implementation of NextGen
  - Catalogue emissions reductions associated with the existing use of advanced navigation technology.
  - Project potential emissions reductions associated with additional NextGen improvements.

**Timing:**

- 2010 - Identify opportunities to assist FAA in achieving goals in FAA’s Roadmap for Implementation.
  - Carry out actions identified above on a timely basis to assist FAA achieve goals in Roadmap for implementation

- 2010 – Identify existing emissions reductions resulting from advanced navigation technologies

- 2011 – Identify potential emissions reductions associated with full implementation of NextGen.
  - Revise project as NextGen is implemented to determine whether projections are accurate and what level of emissions reductions are being achieved.

**Parties Involved:** The State of Alaska will lead this effort with input and assistance from airports and aircraft operators.

**Operational Measures**

Identify existing and new operational best practices for maximizing fuel efficiency in the aviation sector, facilitate (including through financial incentives) voluntary implementation of such practices where practical, and evaluate resulting emissions benefits where possible. Potential operational strategies include:

- Using electric power supplied from airport gates in lieu of running aircraft auxiliary power units (APUs).

- Development of infrastructure to support the operation of electrified airport ground support equipment (GSE), which typically is provided by the airport but may be funded through federal programs.
Strategies under pilot control that may result from a system-wide assessment of airline operations, such as more use of single-engine taxi, less use of reverse thrust, and minimizing excess fuel loading (to reduce weight).

Many of these practices require the cooperation of multiple parties. Therefore, the State will facilitate cooperation among airports, aircraft owners and operators, and other parties where necessary, to implement operational best practices.

**Goals:**

- Identify measures currently used and evaluate the emissions benefits that are achieved from those measures.
- Identify new measures that will lead to additional benefits.
- Identify means to facilitate voluntary implementation of identified measures.

**Timing:**

- Identify existing measures and means to facilitate voluntary implementation (2010-2011)
- Identify new measures and means to facilitate voluntary implementation (ongoing – prepare initial report 2011)

**Parties Involved:** Aircraft operators, airports, State of Alaska

**Alternative Fuels for Aviation**

Adopt a clear statement that it is the policy of the State of Alaska to facilitate the rapid introduction of alternative fuels for aviation that are both economically viable and have a reduced emissions profile on a life-cycle basis. Identify and implement measures to support the production, distribution and use of alternative aviation fuels.

**Goals:** Similar to Operational Measure (above)

**Timing:** Similar to Operational Measure (above)

**Parties Involved:** Aircraft operators, airports, State of Alaska, fuel providers

**Implementation Mechanisms**
