

# Wastewater Collection Classification Form

Wastewater collection systems are classified according to the number of service connections and the number of main line lift stations.

First, the classification is determined based on the number of service connections.

Second, the classification is elevated one class if the system has 15 or more mainline lift stations.

A system where gravity is the only means of wastewater flow is classified as class 1 regardless of the number of service connections.

A system that is classified as class 4 based on the number of service connections does not increase in classification even if there are 15 or more main line lift stations.

No. of Service Connections	Classification
15 to 500	1
501 to 5,000	2
5,001 to 15,000	3
More than 15,000	4

If 15 or more mainline lift stations, then increase one class.

If gravity is the only means of flow, then class 1 regardless of the number of service connections.

A service connection is defined as a pipe, with all its parts, that connects a sewer main with building plumbing. As such, sinks, showers, toilets, etc. within a building are **not** considered service connections.
